

LO: Students will be able to name basic organic compounds.

DOL: Students will correctly identify organic compounds at least 4/5 times.

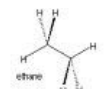

**Organic Chemistry**

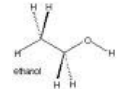

The Chemistry of Carbon

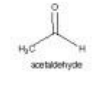

methane

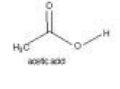

ethane

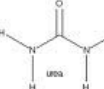

ethanol

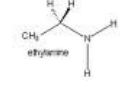

acetaldehyde

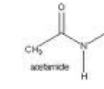

acetic acid

urea

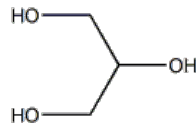

ethylamine

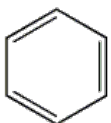

acetamide

glycerol

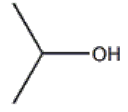

benzene

octane

isopropyl alcohol

pentene

acetylene

$\text{Na}^+ \text{ } ^-\text{C}\equiv\text{N}$

sodium cyanide

**Organic Chemistry** is the study of the molecular compounds that contain carbon. Compounds that contain carbon are known as organic compounds.

Most of the the molecules in all living things on Earth are carbon based, meaning that they are made mostly of carbon atoms.

Some examples of carbon based compounds include

Plastics made from petroleum

Gasoline

Cosmetics

Medicines

Food products.

Nov 13-2:30 PM

**An atom is most stable when its outer electron energy level is filled. Carbon has four valence electrons and four empty spots in its outer electron energy level.**

Carbon is a group **4A** element, meaning that it has **4** valence electrons

Nov 13-2:31 PM

Carbon needs to form four bonds with other atoms to become stable

	$\begin{array}{c}   \\ -C- \\   \end{array}$	$\begin{array}{c}   \\ -C= \end{array}$	$=C=$	$-C\equiv$
Number of single bonds				
Number of double bonds				
Total Number of Bonds				

Nov 13-2:35 PM

**Functional Groups** are characteristic arrangements (structures and bonds) of atoms within a molecule that are largely responsible for the physical and chemical properties of the compound

Nov 13-2:37 PM

The simplest carbon compounds are hydrocarbons they contain only **hydrogen and carbon**. These molecules can contain single, double or triple bonds

Hydrocarbons		
Single Bond	$C - C$	<b><u>Alkane</u></b>
Double Bond	$C = C$	<b><u>Alkene</u></b>
Triple Bond	$C \equiv C$	<b><u>Alkyne</u></b>

Nov 13-2:39 PM

-Alkanes are a hydrocarbon that contains only carbon-carbon single bonds

-The general formula for alkanes is  $C_nH_{2n+2}$

-To name Alkanes we use a **prefix** which indicates how many carbon atoms are in the molecule, added to the **suffix *ane*** which indicates that there are only single bonds

Nov 13-2:39 PM

Number of Carbon	Prefix	Name	Use
1	Meth		gaseous fuel
2	Eth		gaseous fuel, starting compound for plastic
3	Prop		gaseous fuel
4	But		gaseous fuel
5	Pent		solvents
6	Hex		solvents, liquid fuel
7	Hept		liquid fuel
8	Oct		liquid fuel

Nov 13-2:40 PM

There are five ways to represent organic compounds

1. Chemical formula: Tells you the number of each type of atom
2. Lewis Dot Diagram: shows how valence electrons are shared (uses dots)
3. Structural Diagram: shows the bonds between atoms (uses a line)
4. Condensed Diagram: only shows the bonds between carbons (uses a line)
5. Line Diagram: A line showing the bonds between atoms. The end of each segment represents a carbon atom

Nov 13-2:41 PM

Compound: Butane	
Chemical Formula	C <sub>4</sub> H <sub>10</sub>
Lewis Dot Diagram	<pre>       H H H H               H : C : C : C : C : H                     H H H H           </pre>
Structural Diagram	<pre>       H H H H               H-C-C-C-C-H                     H H H H           </pre>
Condensed Diagram	CH <sub>3</sub> -CH <sub>2</sub> -CH <sub>2</sub> -CH <sub>3</sub>
Line Diagram	 (4 points means there are 4 carbon)
